**RE: MIGRATION OF ARSENIC TO GROUNDWATER EVALUATION,
GLEN COVE WATERFRONT REDEVELOPMENT PROJECT**

Dear Mr. Koch:

On May 15, 2015 RXR Glen Isle Partners, LLC (RXR) contracted Ramboll Environ to review the data collected for the Garvies Point redevelopment project, Glen Cove, NY (Site) for the purpose of assisting RXR and the City of Glen Cove in responding to the NYSDEC and USEPA (Agencies) request to conduct additional SPLP analyses, and to perform an evaluation that meets the Agencies' objective of identifying areas where the management of soil is warranted to ensure that arsenic migration to groundwater will not pose an unacceptable risk to human health or the environment after the Site is redeveloped.

Ramboll Environ
214 Carnegie Center
Suite 200
Princeton, NJ 08540
USA

T +1 609 452 9000
F +1 609 452 0284
www.ramboll-environ.com

RXR requested that Ramboll Environ:

1. Determine if the existing site data would be adequate to support the evaluation;
2. Calculate a site-specific K_d for arsenic using the site-specific SPLP data in accordance with NJDEP's 2013 guidance as recommended by the Agencies;
3. Utilize the site-specific K_d in conjunction with NYSDEC and USEPA guidance in order to calculate a soil migration to groundwater screening level for arsenic that could be used to support the evaluation; and
4. Following the Agencies' review and approval of the evaluation described in this letter, utilize the same methodology to evaluate soil lead migration to groundwater.

This letter summarizes the evaluation Ramboll Environ performed to identify areas at the Site where the management of arsenic in soil may be warranted to ensure that arsenic migration to groundwater does not pose an unacceptable risk to human health or the environment after the Site is redeveloped.

In summary, the evaluation involved derivation of a site-specific partition coefficient (K_d) for arsenic using the leachate test data that have been collected at the site and using this K_d to derive a soil migration to groundwater screening level, based on the arsenic water quality standard for Class GA groundwater and NYSDEC's default DAF. The screening level was then used to identify arsenic concentrations at the site that exceed the screening level, and thus, may warrant consideration for management.

Derivation of the screening level and the results from comparison to the arsenic soil data are discussed below and summarized in the attached tables and figures. Since the screening analysis is designed to be conservative, the soil screening results were

compared with recent arsenic groundwater monitoring data to assess consistency in predicted versus actual arsenic leaching impacts. This assessment is also discussed below.

Ramboll Environ reviewed the existing arsenic data collected from the site (i.e., soil, SPLP, and groundwater) and concluded that these data are adequate to support the evaluation of arsenic soil migration to groundwater.

SCREENING LEVEL DERIVATION

The soil migration to groundwater screening level was calculated using methodology recommended by USEPA (1996)¹ for developing such screening levels for Superfund sites. Specifically, the soil screening level C_{soil} (mg/kg) was calculated by using the following equation:

$$C_{soil} = C_{gw} \left(K_d + \frac{\theta_w}{\rho_b} \right) \times DAF$$

where C_{gw} is the groundwater standard (mg/L), K_d is the partition coefficient (L/kg), θ_w is the water-filled porosity (L/L), ρ_b is the dry soil bulk density (kg/L), and DAF is the dilution/attenuation factor.

The site-specific arsenic K_d was estimated from the 20 SPLP analyses that had been performed on soil samples collected from the Captains Cove and Li Tungsten sites. A site-specific K_d was first calculated for each of the 20 pairs of SPLP and total arsenic data using NJDEP's 2013 guidance² and spreadsheet. **Attachment A** presents the details of the site-specific K_d calculations. Because these K_d values span more than an order of magnitude, the lowest value of 116.6 L/kg was conservatively selected for use in deriving the screening level, as recommended by NJDEP's guidance. Use of this K_d is expected to greatly overestimate the potential for arsenic to leach from soil across most of the site.

The groundwater standard utilized in the derivation was the arsenic water quality standard of 25 ug/L for Class GA H(WS) water. Per 6 NYCRR Part §701.15, Class GA groundwater is groundwater that can be used as a source of potable water. Use of this groundwater standard is highly conservative because the shallow groundwater at and downgradient of the site is not used, and not expected to be used, for potable purposes, as noted in USEPA's 2005 *Explanation of Significant Differences for the Li Tungsten Superfund Site*:

"The preference for no action [for groundwater] is based on the sporadic and generally low-level nature of the inorganic contamination; as well as the impacts of saltwater intrusion on the Aquifer and the availability of the City's potable water supply to the affected area, which significantly contribute to the non-use of the contaminated aquifer as a potable water source. Nassau County Public Health Ordinance Article 4, which prohibits the installation of new private potable water systems in areas served by a public water supply, should effectively preclude any future potable water well installations in this portion of the aquifer."

¹ The United States Environmental Protection Agency (USEPA). 1996. Soil Screening Guidance: User's Guide. Office of Solid Waste and Emergency Response. 9355.4-23. July.

² New Jersey Department of Environmental Protection (NJDEP). 2013. *Synthetic Precipitation Leaching Procedure to Develop New Jersey Site-Specific Impact to Ground Water Remediation Standards*, Section IV.B, Option 2, p. 12-13.

The screening level was calculated using a DAF of 100, consistent with the assumptions NYSDEC uses to derive its soil cleanup objectives (NYSDEC 2006³, Section 7.5). The values of θ_w and p_b used in the calculation (0.15 and 1.5 kg/L, respectively) are the default values recommended by USEPA (1996)⁴.

Using the values discussed above, the arsenic migration to groundwater screening level is 292 mg/kg. **Attachment B** shows the calculation of this screening level⁵.

COMPARISON TO SOIL DATA

The arsenic soil data from the site were compared to the screening level on a sample-by-sample basis. The data included in the comparison and the results of the comparison are presented in Table C.1 and Figure C.1 in **Attachment C**. As shown in Table C.1, 12 locations at the site have at least one arsenic concentration exceeding the screening level. At most of these locations, the concentrations exceeding the screening level are underlain by soil with arsenic concentrations that do not exceed the screening level. Specifically, only 2 of the 12 locations (EP020 and LPC-GA-EW6_A) have arsenic concentrations above the screening level in their deepest sample, indicating that the other 10 locations do not have a soil concentration profile with the potential to cause shallow groundwater under the site to exceed the Class GA groundwater standard for arsenic. Figure C.2 shows these two locations.

ADDITIONAL CONSIDERATIONS

The above screening results were compared to the recent arsenic groundwater data in **Attachment D**, to assess the degree of consistency between screening results and actual impacts on groundwater. As shown on the **Attachment D** figure⁶, dissolved-phase arsenic groundwater concentrations⁷ exceed the Class GA standard of 25 ug/L at only the following locations: CC-C-028 (GW), CC-C-048 (GW), CC-C-033 (GW), and MW-1.

These locations are in the area where arsenic-contaminated soil was excavated in January 2001 during the remedial action for OU-2, Area A and Area A Prime⁸. As shown on Figure C.1, the soil remaining in this area does not have arsenic concentrations exceeding the migration to groundwater screening level and is not expected to have the potential to impact groundwater.

In the vicinity of soil sampling locations EP020 and LPC-GA-EW6_A, where arsenic soil concentrations in the deepest samples exceed the screening level, dissolved-phase arsenic concentrations are below the 25 ug/L standard, based on data from LT-R-002 (GW), MW-CDM-2, EMW-4, LT-C-055 (GW), and LT-C-054 (GW). This difference between predicted and actual impacts on groundwater suggests that the screening level is overestimating arsenic migration from the soil in these areas (e.g., the K_d could

³ New York State Department of Environmental Conservation (NYSDEC). 2006. *New York State Brownfield Cleanup Program Development of Soil Cleanup Objectives Technical Support Document*. September.

⁴ The United States Environmental Protection Agency (USEPA). 1996. *Soil Screening Guidance: User's Guide*. Office of Solid Waste and Emergency Response. 9355.4-23. July.

⁵ This screening level differs from NJDEP's soil remediation standard of 19 mg/kg derived under Option 2 because NJDEP used a groundwater quality criterion (GWQC) of 0.02 ug/L with a DAF of 20. As shown on Attachment A, multiplying the DAF by the GWQC gives a leachate criterion of 0.4 ug/L, which NJDEP replaced with the aqueous reporting limit of 3 ug/L. Multiplying this adjusted leachate criterion by $(K_d + \theta_w/p_b)$ gives 0.350 mg/kg. NJDEP then replaced this result with the default NJ arsenic soil background level of 19 mg/kg.

⁶ P.W. Grosser Consulting (PWGC). 2015. *Arsenic and Lead Groundwater Report – Garvies' Point Road Redevelopment Project*. February.

⁷ Dissolved-phase concentrations are more appropriate than total concentrations for assessing consistency with migration to groundwater screening results because the screening analysis provides conservative estimates of potential impact on dissolved-phase rather than total groundwater concentrations.

⁸ P. W. Grosser Consulting (PWGC). 2014. *Pre-Construction Confirmatory/Insurance Data Gap Subsurface Investigation Report*.

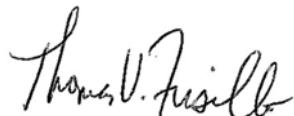

be higher for the soil in these areas than the minimum of the 20 values used in deriving the screening level).

SUMMARY OF FINDINGS

An arsenic migration to groundwater soil screening level of 292 mg/kg was calculated using the most conservative K_d estimated from the 20 SPLP analyses performed at the Site, the arsenic water quality standard of 25 ug/L for Class GA H(WS) water, and a generic DAF of 100 consistent with the assumptions NYSDEC uses to derive its soil cleanup objectives. Two boring locations at the Site have soil arsenic concentrations in the deepest sample that exceed this screening level. However, the migration to groundwater analysis and the groundwater monitoring data are consistent in showing that the arsenic concentrations remaining in soil at the vast majority, if not all, of the site have little or no potential to adversely impact the shallow groundwater. The soil arsenic concentrations at locations EP020 and LPC-GA-EW6_A exceed the migration to groundwater screening level, but the groundwater monitoring data in the vicinity of these locations show no evidence of soil leaching impact, suggesting that the screening level overestimates actual arsenic leaching from soil at the site (which is consistent with the conservative nature of the screening level's derivation, including the use of the lowest among 20 site-specific K_d estimates from soil across the site). Taken together, the migration to groundwater analysis and the groundwater data provide a high degree of confidence that arsenic concentrations in soil at the site are sufficiently low to not warrant management to prevent impacts on groundwater. If it is desirable nevertheless to have additional assurance that arsenic will not impact groundwater, the site redevelopment plans for the areas around EP020 and LPC-GA-EW6_A could incorporate provisions to reduce infiltration.

We would be happy to discuss with you, the project team, USEPA, and/or NYSDEC should there be any questions regarding our evaluation.

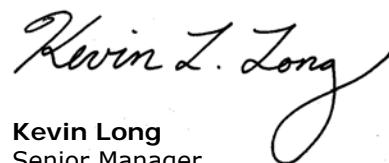

Sincerely,

Thomas V. Fusillo, LEP, CGWP

**Table C.1 Comparison of Soil Arsenic Concentrations
to Soil MTGW Screening Level**
Glen Cove Waterfront Redevelopment Project; Glen Cove, NY

Sampling Location	Top Depth (ft)	Bottom Depth (ft)	Sample Date	Conc (mg/kg)	Ratio of Conc to MTGW SSL
SBFT-1_A	0	2	4/1/2015	3.6	1.2E-02
SBFT-1_A	2	4	4/1/2015	3.3	1.1E-02
SBFT-1_A	4	6	4/1/2015	4.5	1.5E-02
SBFT-1_A	6	8	4/1/2015	21.2	7.3E-02
SBFT-1_A	8	10	4/1/2015	5.5	1.9E-02
Notes:					
Migration to groundwater soil screening level (MtGW SSL) = 292 mg/kg.					
Ratios of concentration to MTGW SSL above 1 are grey-shaded.					
For nondetect samples, concentration assumed to equal 1/2 the detection limit.
